**Product features**

<b>Operating mode</b>	<p>Conventional operation:</p> <p>The actuator is connected with an analog control signal Y (note the operating range) and drives to the position defined.</p> <p>The actuator moves the valve to the operating position at the same time as tensioning the return spring. The damper is turned back to the fail-safe position by spring force when the supply voltage is interrupted.</p> <p>Operation on Bus:</p> <p>The actuator receives its digital control signal from the higher level controller via the MP-Bus and drives to the position defined. Connection U serves as communication interface and does not supply an analogue measuring voltage.</p>
<b>Converter for sensors</b>	<p>Connection option for an active sensor. The actuator serves as an analog/digital converter for the transmission of the sensor signal via MP-Bus to the higher-level system.</p> <p>Additional material may be required for the sensor connection. See "Electrical accessories".</p>
<b>Configurable Device</b>	<p>The factory settings cover the most common applications. Single parameters can be modified with the Belimo Assistant 2 or ZTH US.</p>
<b>Adjustable angle of rotation</b>	<p>Adjustable angle of rotation with mechanical end stops.</p>
<b>High functional reliability</b>	<p>The actuator is overload protected, requires no limit switches and automatically stops when the end stop is reached.</p>
<b>Innovative motorization</b>	<p>The actuator uses the powerful Belimo M600 microchip in combination with the INFORM method. It provides the full starting torque from a standstill with high precision (sensorless INFORM-Drive by Prof. Schrödl).</p>
<b>Home position</b>	<p>The first time the supply voltage is switched on, i.e. at the time of commissioning, the actuator carries out a synchronization. The synchronization is in the home position (0%).</p> <p>The actuator then moves into the position defined by the control signal.</p>

Product features

**Adaptation** An adaptation can be triggered manually by switching the direction-of-rotation switch from the left to the right twice within 5 s or with Belimo Assistant 2. Both mechanical end stops are detected during the adaptation (entire setting range).  
The actuator then moves into the position defined by the control signal.  
A range of settings can be made using the Belimo Assistant 2.

Control on/off

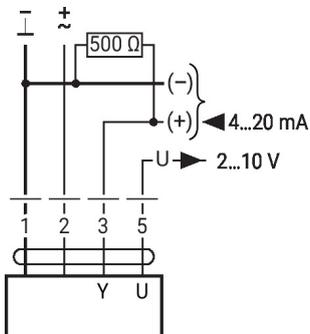

AC/DC 24 V, modulating

Auxiliary switch

Control with 4...20 mA via external resistor

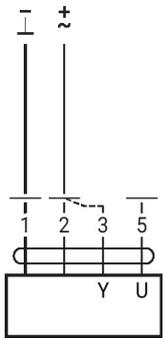

**Caution:**  
The operating range must be set to DC 2...10 V.  
The 500 Ohm resistor converts the 4...20 mA current signal to a voltage signal DC 2...10 V.
