Piping Package with PI Zone Valve, Internal thread

- For closed water systems
- For modulating control of air-handling and heating systems on the water side
- Snap-assembly of the actuator
- With measuring ports (P/T ports)
- With form-fit thermal insulation shell

Technical data

Functional data	Fluid	Water, water with glycol up to max. 50% vol.
	Fluid temperature	2...90°C [36...194°F]
	Close-off pressure	Δps 1400 kPa
	Differential pressure	Δp 16...350 kPa (PIQCV)
	Pressure stability	±5% with a pressure value of 35...350 kPa ±10% with a pressure value of 16...35 kPa
	Flow characteristic	equal percentage (VDI/VDE 2173), optimised in the opening range
	Flow setting	See installation instruction
	Angle of rotation	90°
	Angle of rotation note	Operating range 15...90°
	Pipe connection	Internal thread according to ISO 7-1
	Installation orientation	upright to horizontal (in relation to the spindle)
	Servicing	maintenance-free (excl. strainer)
Materials	Valve body	Brass
	Closing element	Stainless steel
	Spindle	Stainless steel
	Spindle seal	EPDM O-ring
	Seat	PTFE, O-ring EPDM
Terms	Abbreviations	V'nom = nominal flow with valve completely opened V'max = maximum flow, set by the angle of rotation limitation on the actuator Sv = Rangeability V'nom/V'min

Safety notes

- The valve has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.
- Only authorised specialists may carry out installation. All applicable legal or institutional installation regulations must be complied with during installation.
- The valve does not contain any parts that can be replaced or repaired by the user.
- The valve may not be disposed of as household refuse. All locally valid regulations and requirements must be observed.
- When determining the flow rate characteristic of controlled devices, the recognised directives must be observed.

Product features

Operating mode
The ball valve is adjusted by a rotary actuator. The actuator is controlled by a commercially available modulating or 3-point control system and moves the ball of the valve – the throttling device – to the position dictated by the control signal. Open the characterised control valve counterclockwise and close it clockwise.

Flow characteristic
Equal percentage flow control is ensured by the special design of the ball.

Constant flow volume
With a differential pressure of 16...350 kPa, a constant flow volume is achieved thanks to the integrated differential pressure controller. Independently of the differential pressure through the valve, a valve authority of 1 is achieved. Even with pressure variations and in the partial load range, the flow rate remains constant with each respective opening position (angle of rotation) and ensures a steady control.

Measuring ports (P/T ports)
The valve has two measurement ports. The total drop in pressure across the valve can be determined using the measurement points at the valve inlet (P1) and outlet (P3).

The measurement ports can be used to easily establish whether the actual differential pressure across the valve is within the admissible range of 16...350 kPa. If it is, the valve operates independently of pressure and the correct flow rate is automatically ensured by the valve according to the setting table.

The differential pressure measurement can also be used to optimise the pump setting. This involves reducing the pump head until only the minimum differential pressure required (16 kPa) is still present across the valve at the point of lowest pressure (the furthest away from the pump in hydronic terms).

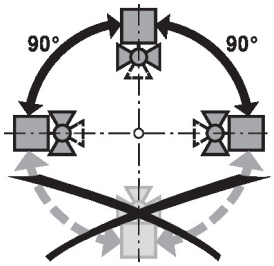
Accessories

Mechanical accessories

Description	Type
Flow limiter PIQCV	ZCQ-FL

Installation notes

Permissible installation orientation
The ball valve can be installed upright to horizontal. The ball valve may not be installed in a hanging position, i.e. with the spindle pointing downwards.



Installation in return
Installation in the return is recommended.

Water quality requirements
The water quality requirements specified in VDI 2035 must be adhered to.

Belimo valves are regulating devices. For the valves to function correctly in the long term, they must be kept free from particle debris (e.g. welding beads during installation work). The installation of a suitable strainer is recommended.

Servicing
Ball valves and rotary actuators are maintenance-free.

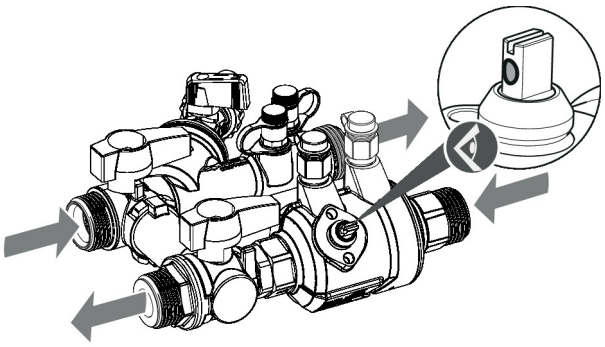
Before any service work on the control element is carried out, it is essential to isolate the rotary actuator from the power supply (by unplugging the electrical cable if necessary). Any pumps in the part of the piping system concerned must also be switched off and the appropriate slide valves closed (allow all components to cool down first if necessary and always reduce the system pressure to ambient pressure level).

The system must not be returned to service until the ball valve and the rotary actuator have been correctly reassembled in accordance with the instructions and the pipeline has been refilled by professionally trained personnel.

Installation notes

Flow direction

The direction of flow, specified by an arrow on the housing, is to be complied with during normal operation, since otherwise the ball valve could become damaged. Please ensure that the ball is in the correct position (marking on the spindle).



Flow setting

The angle of rotation of the CQ.. actuator can be changed by end stop clip in 2.5° increments. This is used to set the V'max-value (maximum flow rate of the valve).

Remove end stop clip and place at desired position.

After every change of the flow setting by means of end stop clip, an adaptation must be triggered on the modulating actuators.
