	Ambient temperature note	according to IP66/67 damper actuator

Safety notes

- It is absolutely imperative that operators ensure that both heating device and actuator are disconnected from the voltage source before settings or manipulations are carried out on the device.
- The heating device itself is not permitted to be removed. The entire actuator must be replaced when repair or warranty work is being performed!
- The self-regulating function of the PTC heating element is not a substitute for the utilisation of the installed thermostat!
- The thermostat is not permitted to be set at $\geq 30^{\circ}\text{C}$ in the presence of ambient temperatures of $\leq -20^{\circ}\text{C}$.
- The following points must be taken into account with independent, external wiring:
 - All contact between the cables or wires that are introduced and the heating element is to be avoided.
 - Where necessary, use cables with sufficient numbers of wires, so that e.g. the heating and the actuator can be supplied separately with voltage (see «Electrical Installation»).
 - All legal regulations or regulations issued by authorities must be observed.

Product features

Application The thermostat records the temperature in the actuator housing and switches the connected heating system on when the temperature falls below the one that has been set. This prevents the formation of condensation on assemblies and electronic components, even in the presence of frequent and severe temperature fluctuations.

The heating elements is designed for continuous operation.
