

Energy metering pressure independent control valve that optimizes, documents and proves water coil performance in chilled and hot water systems.

- Nominal voltage AC/DC 24 V
- Control Modulating, Communicative, Hybrid, Cloud
- Measures Energy
- Controls Power
- Manages Delta T

5-year warranty

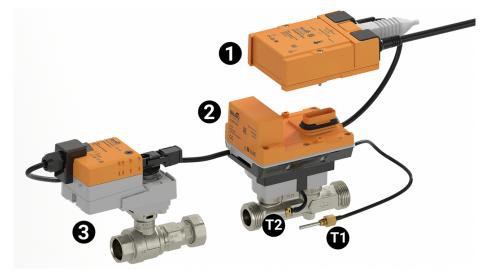

## Structure

### Components

The Belimo Energy Valve consists of a characterized control valve, an actuator and a thermal energy meter with a logic and a sensor module.

The logic module provides the power supply, the communication interface and the NFC connection of the energy meter. All relevant data are measured and recorded in the sensor module.

This modular design of the energy meter means that the logic module can remain in the system if the sensor module is replaced.

External temperature sensor T1 Integrated temperature sensor T2 Logic module 1

Sensor module 2

Characterized control valve with actuator 3

## **Technical data**

### **Electrical data**

Nominal voltage	AC/DC 24 V
Nominal voltage frequency	50/60 Hz
Nominal voltage range	AC 19.228.8 V / DC 21.628.8 V
Power consumption in operation	4 W
Transformer sizing	7 VA
Connection Ethernet	RJ45 socket

### Safety notes

Ball

Materials

 This device has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.

stainless steel

- Outdoor application: only possible in case that no (sea) water, snow, ice, insolation or aggressive gases interfere directly with the actuator and that is ensured that the ambient conditions remain at any time within the thresholds according to the data sheet.
- Only authorized specialists may carry out installation. All applicable legal or institutional installation regulations must be complied with during installation.
- The device contains electrical and electronic components and must not be disposed of as household refuse. All locally valid regulations and requirements must be observed.

#### **Product features**

**Application** 

Water-side control of heating and cooling systems for AHUs and water coils.

Operation

The Energy Valve is an energy metering pressure independent control valve that measures, documents and optimises water coil performance.

Operating mode

The HVAC performance device is comprised of four components: characterized control valve (CCV), measuring pipe with flow sensor, temperature sensors and the actuator itself. The adjusted maximum flow (V'max) is assigned to the maximum control signal DDC (typically 10 V / 100%). Alternatively, the control signal DDC can be assigned to the valve opening angle or to the power required on the heat exchanger (see power control). The HVAC performance device can be controlled via communicative or analog signals. The fluid is detected by the sensor in the measuring pipe and is applied as the flow value. The measured value is balanced with the setpoint. The actuator corrects the deviation by changing the valve position. The angle of rotation  $\alpha$  varies according to the differential pressure through the control element (see flow curves).

Flow measurement

\*All flow tolerances are at 68°F [20°C] & water.

#### **Accessories**

Replacement sensor modules	Description	Туре

#### **Electrical installation**

Supply from isolating transformer.

Parallel connection of other actuators possible. Observe the performance data.

The wiring of the line for BACnet MS/TP / Modbus RTU is to be carried out in accordance with applicable RS485 regulations.

Modbus / BACnet: Supply and communication are not galvanically isolated. Connect earth signal of the devices with one another.

Sensor connection: An additional sensor can optionally be connected to the thermal energy meter. This can be a passive resistance sensor Pt1000, Ni1000, NTC10k (10k2), an active sensor with output DC 0...10 V or a switching contact. Thus the analogue signal of the sensor can be easily digitised with the thermal energy meter and transferred to the corresponding bus system.

Analog output: An analog output is available on the thermal energy meter. This can be selected as DC 0...10 V, DC 0.5...10 V or DC 2...10 V. For example, the flow rate or the temperature of the temperature sensor T1 / T2 can be output as an analog value.

#### Wire colors:

C2 = D + = B (wire 7)

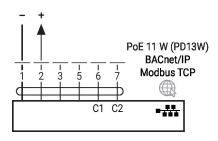

## **Electrical installation**

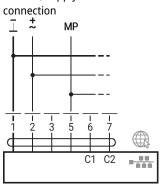

BACnet/IP / Modbus TCP

PoE with BACnet/IP / Modbus TCP

MP-Bus, supply via 3-wire

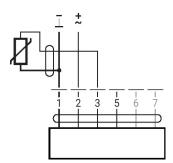

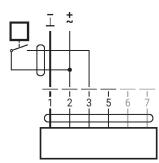

Connection of a notebook for parametrisation and manual control via RJ45.

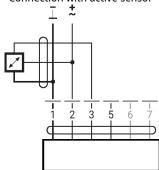

Optional connection via RJ45 (direct connection to notebook / connection via Intranet or Internet) for access to the integrated web server

Connection with passive sensor

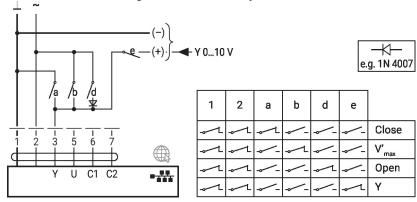

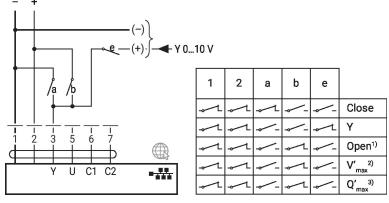

#### **Functions**

## Functions with specific parameters (parametrisation necessary)

Override control and limiting with AC 24 V with relay contacts

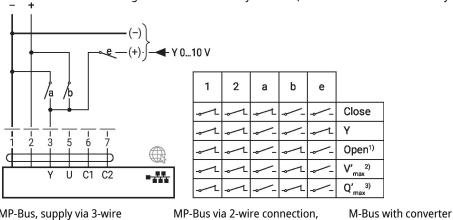

Override control and limiting with DC 24 V with relay contacts (with conventional control or hybrid mode)

- 1) Position control
- 2) Flow control
- 3) Power control

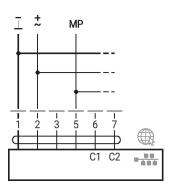

Override control and limiting with DC 24 V with relay contacts (with conventional control or hybrid mode)

local power supply

- 1) Position control
- 2) Flow control
- 3) Power control

MP-Bus, supply via 3-wire connection

G-22PEM-A01 M-Bus

1 2 3 5 6 7

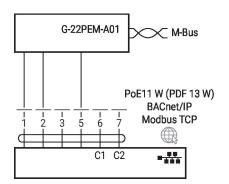

C1 C2

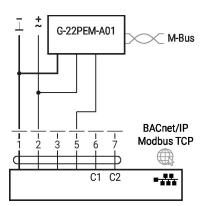

#### **Functions**

### Functions with specific parameters (parametrisation necessary)

M-Bus with converter in parallel mode with PoE with BACnet/IP / Modbus TCP

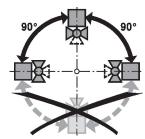

M-Bus with converter in parallel mode with BACnet/IP / Modbus TCP

#### **Installation notes**

#### Permissible installation orientation

The ball valve can be installed upright to horizontal. The ball valve may not be installed in a hanging position, i.e. with the stem pointing downwards.

#### Installation location in return

Installation in the return is recommended.

#### Water quality requirements

The water quality requirements specified in VDI 2035 must be adhered to.

Belimo valves are regulating devices. For the valves to function correctly in the long term, they must be kept free from particle debris (e.g. welding beads during installation work). The installation of a suitable strainer is recommended.

### Servicing

Ball valves, rotary actuators and sensors are maintenance-free.

Before any service work on the control element is carried out, it is essential to isolate the rotary actuator from the power supply (by unplugging the electrical cable if necessary). Any pumps in the part of the piping system concerned must also be switched off and the appropriate slide valves closed (allow all components to cool down first if necessary and always reduce the system pressure to ambient pressure level).

The system must not be returned to service until the ball valve and the rotary actuator have been correctly reassembled in accordance with the instructions and the pipeline has been refilled by professionally trained personnel.

### Flow direction

The direction of flow, specified by an arrow on the housing, is to be complied with, since otherwise the flow rate will be measured incorrectly.

# Cleaning of pipes

Before installing the thermal energy meter, the circuit must be thoroughly rinsed to remove impurities.

## Prevention of stresses

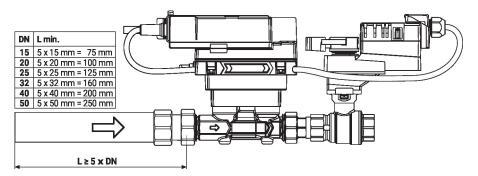

The energy meter must not be subjected to excessive stress caused by pipes or fittings.

## **Installation notes**

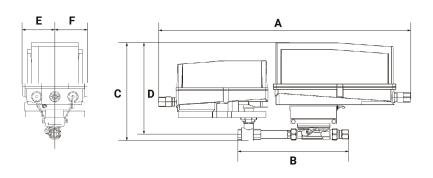

### **Inlet section**

In order to achieve the specified measuring accuracy, a flow-calming section or inflow section in the direction of the flow is to be provided upstream from the flow sensor. Its dimensions should be at least 5 x DN.

# **Dimensions**
